Final Project

robotic manipulator

The Figure shows a 2DOF robotic manipulator (used in homework 1).

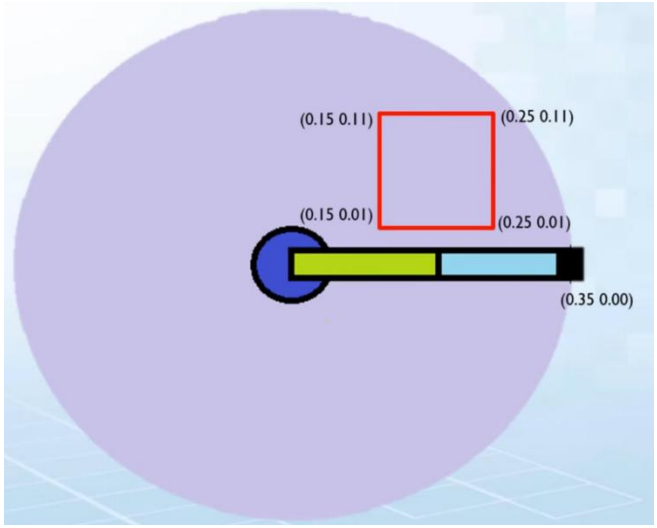

1- Create a Simulink Model of the robotic arm shown in the Figure.

2- Write the DH parameters of the robotic arm.

3- Use the matlab robotics toolbox to create a code that calculates the forward and inverse kinematics using the DH parameters (rigid body trees).

4- Make the robotic arm move in a square shape with the workspace. As shown in figure:

Marking:

- Make sure your project runs properly, and you are prepared to discuss it. (5 marks).

- Submit a Report (PDF) that includes your project details (calculations, assumptions, dh parameters …).

Program code. Add a video link of your running project and test it. And include 3 real life applications for this project. (5 Marks).
